Dr. Matthias Hölzl Stack December 2, 2020 1/9

Goals

- Create a simple Stack data structure using TDD
- Proceed incrementally, baby steps
- This exercise is meant to demonstrate
 - how to develop features incrementally using TDD
 - how to write good tests that help you to grow your design
- Therefore: Please do not look ahead in this document!
 Only move to the next page after having finished the current exercise.

2/9

Stack

- Clone the repository at https://github.com/hoelzl/CleanCodeCppCatch.git (you have probably already done this when you're reading this document.)
- Open the folder Stack in your IDE/editor of choice.
- Ensure that you can build the target StackTest and that the test fails when you execute it
- Solve simply!

3/9

Stack

- Implement a Stack data type for integers with the following signature:
- void push(int element)
- int pop()
- bool is_empty() const
- If the stack is empty, pop() should throw an exception of type std::out_of_range
- Hint: Use a std::vector<int> as backing storage for the stack.

4/9

Extension (1)

 Extend the Stack data type with a method int size() const that returns the number of elements on the stack.

5/9

Extension (2)

 Extend the Stack data type with a member function int count(int element) const that counts the occurrences of element on the stack.

6/9

Extension (3)

Extend the Stack data type with a member function
 int pop_default(int default)
 that acts like pop() when the stack is not empty and returns default when the stack is empty.

7/9

Extension (4)

• Extend the Stack data type with member functions

```
void set_default(int default)
void clear_default()
```

After set_default(default) has been called, pop() should act like pop_default(default). When clear_default() is called, pop() should revert to its original behavior, i.e., throw an exception when the stack is empty.

8/9

Extension (5)

• Our Stack class will now be used on an embedded system where dynamic memory allocation at runtime is not allowed. Therefore we have to replace its implementation with one that does not use std::vector

Modify your implementation so that it uses a std::array<int, 16> to store its elements. Make push() throw an exception of type std::out_of_range.
